—

SPIE Proceedings Volume 7777

The papers included in this volume were presented at the technical conference cited on the cover and title page. Papers were peer reviewed and published as a special section of the *Journal of Photonics for Energy*. These journal articles reflect the work and thoughts of the authors. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

ISSN: 1947-7988 (Journal of Photonics for Energy)

Article Numbers: Each paper is designated by a unique six-digit article number. Use of article numbers in place of traditional page numbers allows articles to be fully citable as soon as they are published online. References to papers in this special section should be cited using the format shown in the following example:

H. Ohkita et al., "Charge generation dynamics in polymer/polymer solar cells studied by transient absorption spectroscopy," *J. Photon. Energy* 1, 011118 (2011).

Special Section on Organic Photovoltaics

- 011199 Guest Editorial: Special Section on Organic Photovoltaics**
Christoph Brabec, Paul Lane, and Zakya H. Kafafi
- 011120 New fullerene derivatives for the photovoltaic application**
Hassina Derbal-Habak, Celine Bergeret, Jack Cousseau, Jean Jacques Simon, Ludovic Escoubas, and Jean-Michel Nunzi
- 011119 Characteristics and performance of organic photovoltaic cells having the active layer fabricated by ternary organic semiconducting materials**
Shogo Imamura, Teruyoshi Mizutani, Kenzo Kojima, and Shizuyasu Ochiai
- 011118 Charge generation dynamics in polymer/polymer solar cells studied by transient absorption spectroscopy**
Hideo Ohkita, Junya Kosaka, Jiamo Guo, Hiroaki Bente, and Shinzaburo Ito
- 011117 Solution processed hybrid photovoltaics: preparation of a standard ZnO template**
Jonathan Downing, Mary P. Ryan, Natalie Stingelin, and Martyn A. McLachlan
- 011116 Schottky diode based on polyaniline-poly (methyl methacrylate) system**
Tharwat G. Abdel-Malik, Hussen A. Motaweh, and Mohamed O. Abdel-Hamed
- 011115 Organic-inorganic hybrid solar cells made from hyperbranched phthalocyanines**
Yong Li, Ming Yan, Minlin Jiang, Rabin Dhakal, Prem S. Thapaliya, and Xingzhong Yan
- 011114 Open circuit voltage and IV curve shape of ZnPc:C₆₀ solar cells with varied mixing ratio and hole transport layer**
Wolfgang Tress, Steffen Pfuetzner, Karl Leo, and Moritz Riede
- 011113 The effect of p-type doping on the performance of organic thin-film photovoltaic devices— m-MTDATA/C₆₀ and 2-TNATA/C₆₀ systems**
Takao Umeda, Keigo Chujo, Yasuhiro Nomura, Kotaro Tsuchida, Michihiro Hara, Sayo Terashima, Yasuhiro Koji, Hiroshi Kageyama, and Yasuhiko Shirota

- 011112 Using admittance spectroscopy to quantify transport properties of P3HT thin films**
Ka H. Chan and Shu K. So
- 011111 Polymers for organic photovoltaics based on 1,5-bis(2-hexyldecyloxy)-naphthalene, thiophene, and benzothiadiazole**
Jon E. Carlé, Mikkel Jorgensen, and Frederik C. Krebs
- 011110 Transparent conductive oxideless tandem dye-sensitized solar cells consisting of light-splitting structures**
Jun Usagawa, Masaki Kaya, Yuhei Ogomi, Shyam S. Pandey, and Shuzi Hayase
- 011109 Electronic structure of molybdenum-oxide films and associated charge injection mechanisms in organic devices**
Jens Meyer and Antoine Kahn
- 011108 Degradation mechanism of organic photovoltaic devices with bathocuproine buffer layer**
Chih-Chien Lee, Wei-Cheng Su, Jia-Cing Huang, Chi-Feng Lin, and Shun-Wei Liu
- 011107 Self-assembled thienylsilane molecule as interfacial layer for ZnO nanowire/polymer hybrid system**
Tingting Xu, Qiliang Chen, Dai-Hong Lin, Hsueh-Yu Wu, Ching-Fuh Lin, and Qiquan Qiao
- 011106 Functionalized pentacenes for dye-sensitized solar cells**
Zhong Li, Karthik Shankar, Gopal K. Mor, Robert A. Grimminger, Chih-Min Lin, John E. Anthony, and Craig A. Grimes
- 011105 Oxide insertion layer in organic semiconductor devices**
Irfan, Huanjun Ding, Franky So, and Yongli Gao
- 011104 Oxygen- and water-induced degradation of an inverted polymer solar cell: the barrier effect**
Morten V. Madsen, Kion Norrman, and Frederik C. Krebs
- 0111103 Dye-sensitized CuAlO₂ photocathodes for tandem solar cell applications**
Andrew Nattestad, Xiaoli Zhang, Udo Bach, and Yi-Bing Cheng
- 011102 Low-bandgap small molecules for near-infrared photovoltaic applications**
M. Ballarotto, W. N. Herman, and D. B. Romero
- 011101 Optimized solution-processed merocyanine:PCBM organic bulk heterojunction solar cell**

Organic photovoltaics (OPVs) have a long history, stretching back three decades into the 1980s, when first studies were conducted on the photogeneration of charge carriers in organic solids. The breakthrough in this field was in 1995, when Heeger's group published the first efficient solution-processed solar cells based on a bulk heterojunction consisting of a polymer blend with C₆₀, a new concept reported three years earlier by Sariciftci and Heeger.

Since then, many active research activities have been undertaken to develop highly efficient organic photovoltaic devices. The number of papers on organic solar cells has been rising exponentially, and the peak of publications has not yet been reached. Tremendous progress has been made in the synthesis and production of organic solar cells. Companies such as Merck, BASF, and Plextronics have started to commercialize organic semiconducting materials, while companies such as Konarka Technologies, Inc. and Heliatek have begun commercialization of organic solar modules.

Compared to inorganic solar cells, OPVs offer many advantages, such as low cost, high-throughput production, flexible devices, lightweight products, as well as custom-designed colors. On the downside, OPVs still have significantly lower efficiency values and lifetime expectations as compared to their inorganic counterparts. Nevertheless, the most recent National Renewable Energy Lab (NREL) certified power conversion of more than 8%, as reported by Konarka and Heliatek, positions OPVs as the next generation of solar cells and a follow-up technology for thin-film inorganic PVs.

In order to achieve higher efficiency and better lifetime, further development is necessary: stable and low-bandgap semiconductors with excellent charge carrier transport properties are required, concepts to control the microstructure in bulk heterojunction composites are essential, the development of efficient and environmentally stable interface materials has to take place, and, finally, strategies for a cost-efficient and long-time stable packaging process need to be developed. In addition, further fundamental understanding of the photophysical processes, including the different interfaces in organic solar cells, is essential to unravel device degradation mechanisms. For the final product release, light propagation and light management need to become integrated in organic solar modules.

In this special section of the *Journal of Photonics for Energy*, papers that address the above issues and challenges are presented. These papers are based on talks and posters given at the conference on Organic Photovoltaics XI at the SPIE Optics + Photonics meeting held in San Diego in August 2010. We believe that readers will find the results of the studies discussed in these manuscripts interesting, educational, and stimulating, and we hope that you will enjoy reading them.
